2   给定凸包,  $\log n$  内完成各种询问, 具体操作有 :
3   1. 判定一个点是否在凸包内
4   2. 询问凸包外的点到凸包的两个切点
5   3. 询问一个向量关于凸包的切点
6   4. 询问一条直线和凸包的交点
7   INF 为坐标范围, 需要定义点类大于号
8   改成实数只需修改 sign 函数, 以及把 long long 改为 double 即可
9   构造函数时传入凸包要求无重点, 面积非空, 以及 pair(x,y) 的最小点放在第一个

## Tetrahedron Volume

$$V = \frac{\sqrt{4u^2v^2w^2 - \sum_{cyc} u^2(v^2 + w^2 - U^2)^2 + \prod_{cyc} (v^2 + w^2 - U^2)}}{12}$$

## BEST Thoerem

Counting the number of different Eulerian circuits in directed graphs.

$$ec(G) = t_w(G) \prod_{v \in V} (\deg(v) - 1)!$$

When calculating  $t_w(G)$  for directed multigraphs, the entry  $q_{i,j}$  for distinct  $i$  and  $j$  equals  $-m$ , where  $m$  is the number of edges from  $i$  to  $j$ , and the entry  $q_{i,i}$  equals the indegree of  $i$  minus the number of loops at  $i$ . It is a property of Eulerian graphs that  $tv(G) = tw(G)$  for every two vertices  $v$  and  $w$  in a connected Eulerian graph  $G$ .

## 重心

半径为  $r$  , 圆心角为  $\theta$  的扇形重心与圆心的距离为  $\frac{4r \sin(\theta/2)}{3\theta}$

半径为  $r$  , 圆心角为  $\theta$  的圆弧重心与圆心的距离为  $\frac{4r \sin^3(\theta/2)}{3(\theta - \sin(\theta))}$

## Class BigInteger

[java.lang.Object](#)[java.lang.Number](#)[java.math.BigInteger](#)

### All Implemented Interfaces:

[Serializable](#), [Comparable<BigInteger>](#)

```
public class BigInteger
    extends Number
    implements Comparable<BigInteger>
```

Immutable arbitrary-precision integers. All operations behave as if BigIntegers were represented in two's-complement notation (like Java's primitive integer types). BigInteger provides analogues to all of Java's primitive integer operators, and all relevant methods from java.lang.Math. Additionally, BigInteger provides operations for modular arithmetic, GCD calculation, primality testing, prime generation, bit manipulation, and a few other miscellaneous operations.

Semantics of arithmetic operations exactly mimic those of Java's integer arithmetic operators, as defined in *The Java Language Specification*. For example, division by zero throws an ArithmeticException, and division of a negative by a positive yields a negative (or zero) remainder. All of the details in the Spec concerning overflow are ignored, as BigIntegers are made as large as necessary to accommodate the results of an operation.

Semantics of shift operations extend those of Java's shift operators to allow for negative shift distances. A right-shift with a negative shift distance results in a left shift, and vice-versa. The unsigned right shift operator (>>>) is omitted, as this operation makes little sense in combination with the "infinite word size" abstraction provided by this class.

Semantics of bitwise logical operations exactly mimic those of Java's bitwise integer operators. The binary operators (and, or, xor) implicitly perform sign extension on the shorter of the two operands prior to performing the operation.

Comparison operations perform signed integer comparisons, analogous to those performed by Java's relational and equality operators.

Modular arithmetic operations are provided to compute residues, perform exponentiation, and compute multiplicative inverses. These methods always return a non-negative result, between 0 and (modulus - 1), inclusive.

Bit operations operate on a single bit of the two's-complement representation of their operand. If necessary, the operand is sign-extended so that it contains the designated bit. None of the single-bit operations can produce a BigInteger with a different sign from the BigInteger being operated on, as they affect only a single bit, and the "infinite word size" abstraction provided by this class ensures that there are infinitely many "virtual sign bits"

preceding each BigInteger.

For the sake of brevity and clarity, pseudo-code is used throughout the descriptions of BigInteger methods. The pseudo-code expression (i + j) is shorthand for "a BigInteger whose value is that of the BigInteger i plus that of the BigInteger j." The pseudo-code expression (i == j) is shorthand for "true if and only if the BigInteger i represents the same value as the BigInteger j." Other pseudo-code expressions are interpreted similarly.

All methods and constructors in this class throw NullPointerException when passed a null object reference for any input parameter. BigInteger must support values in the range -2<sup>Integer.MAX\_VALUE</sup> (exclusive) to +2<sup>Integer.MAX\_VALUE</sup> (exclusive) and may support values outside of that range. The range of probable prime values is limited and may be less than the full supported positive range of BigInteger. The range must be at least 1 to 2<sup>5000000000</sup>.

**Implementation Note:**

BigInteger constructors and operations throw ArithmeticException when the result is out of the supported range of -2<sup>Integer.MAX\_VALUE</sup> (exclusive) to +2<sup>Integer.MAX\_VALUE</sup> (exclusive).

Modifier and Type	Method and Description
<b>BigInteger</b>	<b>abs()</b> Returns a BigInteger whose value is the absolute value of this BigInteger.
<b>BigInteger</b>	<b>add(BigInteger val)</b> Returns a BigInteger whose value is ( <code>this + val</code> ).
<b>BigInteger</b>	<b>and(BigInteger val)</b> Returns a BigInteger whose value is ( <code>this &amp; val</code> ).
<b>BigInteger</b>	<b>andNot(BigInteger val)</b> Returns a BigInteger whose value is ( <code>this &amp; ~val</code> ).
int	<b>bitCount()</b> Returns the number of bits in the two's complement representation of this BigInteger that differ from its sign bit.
int	<b>bitLength()</b> Returns the number of bits in the minimal two's-complement representation of this BigInteger, <i>excluding</i> a sign bit.
byte	<b>byteValueExact()</b> Converts this BigInteger to a byte, checking for lost information.
<b>BigInteger</b>	<b>clearBit(int n)</b> Returns a BigInteger whose value is equivalent to this BigInteger with the designated bit cleared.
int	<b>compareTo(BigInteger val)</b> Compares this BigInteger with the specified BigInteger.
<b>BigInteger</b>	<b>divide(BigInteger val)</b> Returns the BigInteger that is the quotient of this BigInteger divided by the specified BigInteger.

	Returns a <code>BigInteger</code> whose value is <code>(this / val)</code> .
<code>BigInteger[]</code>	<b><code>divideAndRemainder(BigInteger val)</code></b> Returns an array of two <code>BigInteger</code> s containing <code>(this / val)</code> followed by <code>(this % val)</code> .
<code>double</code>	<b><code>doubleValue()</code></b> Converts this <code>BigInteger</code> to a <code>double</code> .
<code>boolean</code>	<b><code>equals(Object x)</code></b> Compares this <code>BigInteger</code> with the specified <code>Object</code> for equality.
<code>BigInteger</code>	<b><code>flipBit(int n)</code></b> Returns a <code>BigInteger</code> whose value is equivalent to this <code>BigInteger</code> with the designated bit flipped.
<code>float</code>	<b><code>floatValue()</code></b> Converts this <code>BigInteger</code> to a <code>float</code> .
<code>BigInteger</code>	<b><code>gcd(BigInteger val)</code></b> Returns a <code>BigInteger</code> whose value is the greatest common divisor of <code>abs(this)</code> and <code>abs(val)</code> .
<code>int</code>	<b><code>getLowestSetBit()</code></b> Returns the index of the rightmost (lowest-order) one bit in this <code>BigInteger</code> (the number of zero bits to the right of the rightmost one bit).
<code>int</code>	<b><code>hashCode()</code></b> Returns the hash code for this <code>BigInteger</code> .
<code>int</code>	<b><code>intValue()</code></b> Converts this <code>BigInteger</code> to an <code>int</code> .
<code>int</code>	<b><code>intValueExact()</code></b> Converts this <code>BigInteger</code> to an <code>int</code> , checking for lost information.
<code>boolean</code>	<b><code>isProbablePrime(int certainty)</code></b> Returns <code>true</code> if this <code>BigInteger</code> is probably prime, <code>false</code> if it's definitely composite.
<code>long</code>	<b><code>longValue()</code></b> Converts this <code>BigInteger</code> to a <code>long</code> .
<code>long</code>	<b><code>longValueExact()</code></b> Converts this <code>BigInteger</code> to a <code>long</code> , checking for lost information.
<code>BigInteger</code>	<b><code>max(BigInteger val)</code></b> Returns the maximum of this <code>BigInteger</code> and <code>val</code> .
<code>BigInteger</code>	<b><code>min(BigInteger val)</code></b> Returns the minimum of this <code>BigInteger</code> and <code>val</code> .
<code>BigInteger</code>	<b><code>mod(BigInteger m)</code></b> Returns a <code>BigInteger</code> whose value is <code>(this mod m)</code> .

<b>BigInteger</b>	<b>modInverse(BigInteger m)</b> Returns a BigInteger whose value is $(\text{this}^{-1} \bmod m)$ .
<b>BigInteger</b>	<b>modPow(BigInteger exponent, BigInteger m)</b> Returns a BigInteger whose value is $(\text{this}^{\text{exponent}} \bmod m)$ .
<b>BigInteger</b>	<b>multiply(BigInteger val)</b> Returns a BigInteger whose value is $(\text{this} * \text{val})$ .
<b>BigInteger</b>	<b>negate()</b> Returns a BigInteger whose value is $(-\text{this})$ .
<b>BigInteger</b>	<b>nextProbablePrime()</b> Returns the first integer greater than this BigInteger that is probably prime.
<b>BigInteger</b>	<b>not()</b> Returns a BigInteger whose value is $(\sim \text{this})$ .
<b>BigInteger</b>	<b>or(BigInteger val)</b> Returns a BigInteger whose value is $(\text{this}   \text{val})$ .
<b>BigInteger</b>	<b>pow(int exponent)</b> Returns a BigInteger whose value is $(\text{this}^{\text{exponent}})$ .
static <b>BigInteger</b>	<b>probablePrime(int bitLength, Random rnd)</b> Returns a positive BigInteger that is probably prime, with the specified bitLength.
<b>BigInteger</b>	<b>remainder(BigInteger val)</b> Returns a BigInteger whose value is $(\text{this} \% \text{val})$ .
<b>BigInteger</b>	<b>setBit(int n)</b> Returns a BigInteger whose value is equivalent to this BigInteger with the designated bit set.
<b>BigInteger</b>	<b>shiftLeft(int n)</b> Returns a BigInteger whose value is $(\text{this} \ll n)$ .
<b>BigInteger</b>	<b>shiftRight(int n)</b> Returns a BigInteger whose value is $(\text{this} \gg n)$ .
short	<b>shortValueExact()</b> Converts this BigInteger to a short, checking for lost information.
int	<b>signum()</b> Returns the signum function of this BigInteger.
<b>BigInteger</b>	<b>subtract(BigInteger val)</b> Returns a BigInteger whose value is $(\text{this} - \text{val})$ .
boolean	<b>testBit(int n)</b> Returns true if and only if the designated bit is set.
byte[]	<b>toByteArray()</b> Returns a byte array containing the two's complement binary representation of the BigInteger value.

Returns a byte array containing the two's-complement representation of this BigInteger.

**String**

**toString()**

Returns the decimal String representation of this BigInteger.

**String**

**toString(int radix)**

Returns the String representation of this BigInteger in the given radix.

static **BigInteger** **valueOf(long val)**

Returns a BigInteger whose value is equal to that of the specified long.

**BigInteger**

**xor(BigInteger val)**

Returns a BigInteger whose value is (this ^ val).

## Class `TreeMap<K,V>`

java.lang.Object

java.util.AbstractMap&lt;K,V&gt;

java.util.TreeMap&lt;K,V&gt;

### Type Parameters:

K - the type of keys maintained by this map

V - the type of mapped values

### All Implemented Interfaces:

`Serializable`, `Cloneable`, `Map<K,V>`, `NavigableMap<K,V>`, `SortedMap<K,V>`

```
public class TreeMap<K,V>
extends AbstractMap<K,V>
implements NavigableMap<K,V>, Cloneable, Serializable
```

A Red-Black tree based `NavigableMap` implementation. The map is sorted according to the **natural ordering** of its keys, or by a `Comparator` provided at map creation time, depending on which constructor is used.

This implementation provides guaranteed  $\log(n)$  time cost for the `containsKey`, `get`, `put` and `remove` operations. Algorithms are adaptations of those in Cormen, Leiserson, and Rivest's *Introduction to Algorithms*.

Note that the ordering maintained by a tree map, like any sorted map, and whether or not an explicit comparator is provided, must be *consistent with equals* if this sorted map is to correctly implement the `Map` interface. (See `Comparable` or `Comparator` for a precise definition of *consistent with equals*.) This is so because the `Map` interface is defined in terms of the `equals` operation, but a sorted map performs all key comparisons using its `compareTo` (or `compare`) method, so two keys that are deemed equal by this method are, from the standpoint of the sorted map, equal. The behavior of a sorted map is well-defined even if its ordering is inconsistent with `equals`; it just fails to obey the general contract of the `Map` interface.

**Note that this implementation is not synchronized.** If multiple threads access a map concurrently, and at least one of the threads modifies the map structurally, it *must* be synchronized externally. (A structural modification is any operation that adds or deletes one or more mappings; merely changing the value associated with an existing key is not a structural modification.) This is typically accomplished by synchronizing on some object that naturally encapsulates the map. If no such object exists, the map should be "wrapped" using the `Collections.synchronizedSortedMap` method. This is best done at creation time, to prevent accidental unsynchronized access to the map:

```
SortedMap m = Collections.synchronizedSortedMap(new TreeMap(...));
```

The iterators returned by the `iterator` method of the collections returned by all of this

class's "collection view methods" are *fail-fast*: if the map is structurally modified at any time after the iterator is created, in any way except through the iterator's own `remove` method, the iterator will throw a `ConcurrentModificationException`. Thus, in the face of concurrent modification, the iterator fails quickly and cleanly, rather than risking arbitrary, non-deterministic behavior at an undetermined time in the future.

Note that the fail-fast behavior of an iterator cannot be guaranteed as it is, generally speaking, impossible to make any hard guarantees in the presence of unsynchronized concurrent modification. Fail-fast iterators throw `ConcurrentModificationException` on a best-effort basis. Therefore, it would be wrong to write a program that depended on this exception for its correctness: *the fail-fast behavior of iterators should be used only to detect bugs*.

All `Map.Entry` pairs returned by methods in this class and its views represent snapshots of mappings at the time they were produced. They do **not** support the `Entry.setValue` method. (Note however that it is possible to change mappings in the associated map using `put`.)

This class is a member of the [Java Collections Framework](#).

## ***Method Summary***

Modifier and Type	Method and Description
<b>Map.Entry&lt;K, V&gt;</b>	<b>ceilingEntry(K key)</b> Returns a key-value mapping associated with the least key greater than or equal to the given key, or null if there is no such key.
<b>K</b>	<b>ceilingKey(K key)</b> Returns the least key greater than or equal to the given key, or null if there is no such key.
<b>void</b>	<b>clear()</b> Removes all of the mappings from this map.
<b>Object</b>	<b>clone()</b> Returns a shallow copy of this TreeMap instance.
<b>Comparator&lt;? super K&gt;</b>	<b>comparator()</b> Returns the comparator used to order the keys in this map, or null if this map uses the <b>natural ordering</b> of its keys.
<b>boolean</b>	<b>containsKey(Object key)</b> Returns true if this map contains a mapping for the specified key.
<b>boolean</b>	<b>containsValue(Object value)</b> Returns true if this map maps one or more keys to the specified value.
<b>NavigableSet&lt;K&gt;</b>	<b>descendingKeySet()</b> Returns a reverse order <b>NavigableSet</b> view of the keys contained in this map.
<b>NavigableMap&lt;K, V&gt;</b>	<b>descendingMap()</b> Returns a reverse order view of the mappings contained in this map.
<b>Set&lt;Map.Entry&lt;K, V&gt;&gt;</b>	<b>entrySet()</b> Returns a <b>Set</b> view of the mappings contained in this map.
<b>Map.Entry&lt;K, V&gt;</b>	<b>firstEntry()</b> Returns a key-value mapping associated with the least key in this map, or null if the map is empty.
<b>K</b>	<b>firstKey()</b> Returns the first (lowest) key currently in this map.
<b>Map.Entry&lt;K, V&gt;</b>	<b>floorEntry(K key)</b> Returns a key-value mapping associated with the greatest key less than or equal to the given key, or null if there is no such key.
<b>K</b>	<b>floorKey(K key)</b> Returns the greatest key less than or equal to the given key, or null if there is no such key.

or null if there is no such key.

void

**forEach**(**BiConsumer**<? super **K**,? super **V**> action)

Performs the given action for each entry in this map until all entries have been processed or the action throws an exception.

**V**

**get**(**Object** key)

Returns the value to which the specified key is mapped, or null if this map contains no mapping for the key.

**SortedMap**<**K**,**V**>

**headMap**(**K** toKey)

Returns a view of the portion of this map whose keys are strictly less than toKey.

**NavigableMap**<**K**,**V**>

**headMap**(**K** toKey, boolean inclusive)

Returns a view of the portion of this map whose keys are less than (or equal to, if inclusive is true) toKey.

**Map.Entry**<**K**,**V**>

**higherEntry**(**K** key)

Returns a key-value mapping associated with the least key strictly greater than the given key, or null if there is no such key.

**K**

**higherKey**(**K** key)

Returns the least key strictly greater than the given key, or null if there is no such key.

**Set**<**K**>

**keySet**()

Returns a **Set** view of the keys contained in this map.

**Map.Entry**<**K**,**V**>

**lastEntry**()

Returns a key-value mapping associated with the greatest key in this map, or null if the map is empty.

**K**

**lastKey**()

Returns the last (highest) key currently in this map.

**Map.Entry**<**K**,**V**>

**lowerEntry**(**K** key)

Returns a key-value mapping associated with the greatest key strictly less than the given key, or null if there is no such key.

**K**

**lowerKey**(**K** key)

Returns the greatest key strictly less than the given key, or null if there is no such key.

**NavigableSet**<**K**>

**navigableKeySet**()

Returns a **NavigableSet** view of the keys contained in this map.

**Map.Entry**<**K**,**V**>

**pollFirstEntry**()

Removes and returns a key-value mapping associated with the least key in this map, or null if the map is empty.

**Map.Entry**<**K**,**V**>

**pollLastEntry**()

Removes and returns a key-value mapping associated with the greatest key in this map, or null if the map is empty.

the greatest key in this map, or null if the map is empty.

<b>V</b>	<b>put(K key, V value)</b> Associates the specified value with the specified key in this map.
void	<b>putAll(Map&lt;? extends K,? extends V&gt; map)</b> Copies all of the mappings from the specified map to this map.
<b>V</b>	<b>remove(Object key)</b> Removes the mapping for this key from this TreeMap if present.
<b>V</b>	<b>replace(K key, V value)</b> Replaces the entry for the specified key only if it is currently mapped to some value.
boolean	<b>replace(K key, V oldValue, V newValue)</b> Replaces the entry for the specified key only if currently mapped to the specified value.
void	<b>replaceAll(BiFunction&lt;? super K,? super V,? extends V&gt; function)</b> Replaces each entry's value with the result of invoking the given function on that entry until all entries have been processed or the function throws an exception.
int	<b>size()</b> Returns the number of key-value mappings in this map.
<b>NavigableMap&lt;K,V&gt;</b>	<b>subMap(K fromKey, boolean fromInclusive, K toKey, boolean toInclusive)</b> Returns a view of the portion of this map whose keys range from fromKey to toKey.
<b>SortedMap&lt;K,V&gt;</b>	<b>subMap(K fromKey, K toKey)</b> Returns a view of the portion of this map whose keys range from fromKey, inclusive, to toKey, exclusive.
<b>SortedMap&lt;K,V&gt;</b>	<b>tailMap(K fromKey)</b> Returns a view of the portion of this map whose keys are greater than or equal to fromKey.
<b>NavigableMap&lt;K,V&gt;</b>	<b>tailMap(K fromKey, boolean inclusive)</b> Returns a view of the portion of this map whose keys are greater than (or equal to, if inclusive is true) fromKey.
<b>Collection&lt;V&gt;</b>	<b>values()</b> Returns a <b>Collection</b> view of the values contained in this map.
